1. Introduction

KaffeePinoy Rentals (KPR) provides coffee vendo machine sales, rentals, and installment packages to various clients. To manage daily business operations, administrative personnel currently rely on a comprehensive Excel spreadsheet (KPR Client Records & Monitoring System) to manually record and track client details. This includes client names, business addresses, contract start/end dates, deposit amounts, monthly payments, program types of item descriptions, unit IDs, serial numbers, and status tracking.

While functional, relying purely on manual Excel spreadsheets presents significant administrative challenges. As the client list grows, navigating through numerous columns becomes tedious, prone to accidental data overwrites, and difficult to filter or search efficiently. Furthermore, updating client contract statuses and sending payment notifications or contract updates requires separate manual messaging processes outside the system.

To address these operational bottlenecks, the Web-Based Client Records and Monitoring System for KaffeePinoy Rentals is proposed. This web application digitizes the existing Excel monitoring workflow into an organized, web-based admin portal. It allows admin staff to easily encode client details, search master records, track contract terms, and automatically dispatch email notifications to clients.

2. Purpose of the Project

This proposal aims to present a web application that will replace manual Excel record-keeping, streamline client data encoding and contract monitoring, and improve overall administrative efficiency for KaffeePinoy Rentals (KPR).

3. Objectives

3.1 General Objective

To design and develop a Web-Based Client Records and Monitoring System tailored for KaffeePinoy Rentals to centralize client data management and automate notification updates.

3.2 Specific Objectives

- To create a web encoding form based on KPR's client parameters.
- To provide a searchable Master List Directory where admin staff can view, filter, and update client statuses.
- To integrate an Email API that allows administrators to send automated contract receipts and payment alerts to clients with a single click.
- To construct a beginner-friendly MySQL database table mirror of the KPR client record structure.

4. Project Scope

4.1 In Scope

- Admin Login Authentication
- Client Encoding Form (Capturing Name, Address, Job, Contract Start/End, Deposit, Monthly Fee, Discount Type, Program, Item Received, Unit ID, Serial Number, and Status)
- Client Master List Directory with Real-time Search and Status Filtering (Ongoing / Fully Paid / Pulled Out)
- Client Status Update Module
- Automated Email Notifications (Contract / Payment Receipt via Email API Integration)
- Summary Dashboard (Total Active Clients, Total Ongoing Contracts, Total Fully Paid Accounts)

4.2 Out of Scope

- Automatic POS Hardware integration
- Direct Facebook Messenger API integration
- Mobile Native Application version (Web Browser access only)

5. System Features / Functions

Module	Feature	Description
Authentication	Admin Login	Secure access restricted to authorized KPR admin personnel
Data Encoding	Client Record Input Form	Web form used to encode client info, contract terms, deposit, monthly rates, unit ID, and serial numbers
Records Monitoring	Client Master Directory	A centralized table view replacing the Excel sheet, complete with search and status filter features
Notifications	Automated Email Alert	Integrates an Email API to automatically send confirmation emails or notices to clients
Reporting	Admin Summary Dashboard	Displays basic counts of total ongoing clients, pending renewals and total equipment units deployed

6. Technology Stack

Layer	Technology / Tool	Purpose
Frontend (Web)	HTML, CSS JavaScript	Clean web dashboard and tabular layout for client record monitoring

Layer	Technology / Tool	Purpose
Backend / API	Native PHP	Simple server-side processing for saving form inputs, editing records, and pulling database queries
Database	MySQL	Local database management using phpMyAdmin to store the clients table matching KPR records
API Integration	EmailJS / PHPMailer API	Third-party service for sending automated email confirmations to client
Environment Tool	XAMPP	Local web server bundle
Version Control	Git / GitHub	Code tracking and project repository management
Design and Testing	VS Code	Code editor used for writing ad editing system source files

7. Target Users

User Role	Description	Key Needs / Usage
KPR Admin (Staff)	Administrative personnel in charge of client records and contract monitoring	Encodes new client details, searches client files, updates payment/contract status, and dispatches email alerts

8. Project Timeline / Work Plan

Phase	Activities	Estimated Duration
Planning & Requirements Gathering	Analyzing Excel sheet data structure and mapping web form fields	Week 1-2
System Design	UI page wireframe design and MySQL database table creation	Week 3-4
Development	Coding Frontend forms, Backend PHP record handlers, MySQL queries, and Email API	Week 5-9
Testing & QA	Form validation testing, record update verification, and email sending checks	Week 10-11
Deployment and Presentation	System documentation finalization, local server setup, and project presentation	Week 12
